## **Explanation of the Program:**

### **How the Program Works**

The program is contained within a function that starts with an initial balance of 1000. It presents a text menu and waits for the user to make a choice, processing transactions until the user decides to quit.

### **How Loops and Conditions are Used**

A continuous while loop keeps the banking menu active after every action. The loop only stops when the user selects the exit option, which triggers a break command. Inside the loop, if and elif conditional statements evaluate the user's input to trigger the correct process. A try-except block is also used to handle invalid text inputs without crashing the program.

### **How the Balance is Updated**

The balance is stored as a variable. When depositing, the code verifies the amount is positive and adds it to the variable using the += operator. When withdrawing, the program first checks if the requested amount is less than or equal to the current balance; if true, it subtracts the amount using the -= operator.
